

AI

(Brainstorm with a partner or group of three) What are some reasons that being comfortable in Python is helpful for getting computational work done? (Alternatively, if you outsource a computational task to an AI agent, what might be harder if you don't know Python?)

- oversee AI agent
- good prompts
- iterative guidance/refinement
- redirect bad direction
- check errors
- guarantee accuracy
- debug failures
- set up testing
- optimize code

Google form:

In what ways do you think AI assistance may help in learning computing and/or how could relying on it reduce your learning?

efficiency - faster implementation of basics, less wasted time, work/learn higher level concepts, save time debugging tutoring/hands-on, help get unstuck no struggle/no understanding/doesn't stick in memory incorrect information

- writing = thinking
- working through/writing/struggling = learning/remembering/recall
 - problem sets have been key
